### DETAILED ACTION

1. This application has been examined. The claims 1-13 are allowed.

#### *Reasons For Allowance*

2. The following is an examiner's statement of reasons for allowance: The present invention is directed to light-sensitive user input device comprising a co-planar array of light-sensitive devices disposed to sense light transmitted through an input surface of the input device, nearest adjacent light-sensitive devices having a center-to-center spacing of no more than a maximum distance; a stylus configured to emit a light beam detectable by the devices, the light beam exhibiting a cross-sectional profile coupled to the light-sensitive devices. The closest prior art of Bird et al. (US 5,959,617) showed a similar invention; however, they fail to teach that the light beam exhibiting a cross-sectional profile having a known shaped characterized by a known intensity variance across the beam profile, wherein the light beam exhibits a size at the plane of the devices that is greater than the maximum distance when the stylus is contacting the input surface; and electronics coupled to the light-sensitive devices and configured to determine the position of the light beam to within a spacing that is less than the maximum distance using the known intensity variance of the beam profile as claim 1; or emitting the light beam with a known shape characterized by a cross-sectional profile having a known intensity variance, detecting the light beam by at least two of the light-sensitive devices; and determining the position of the light beam to an accuracy that is less than the center-to-center distance between nearest adjacent light-sensitive devices by interpolating signals measured during the detecting step using the known intensity variance of the light beam as claim 11.
